

Honours Lecture Practical

Honours Lecture Practical

Objectives: Rough idea of

- ▶ What R is and how it works
- ▶ What simulation studies are and how they work

Small Print / Assumptions Two sample t-test

1. Normality: Errors are normally distributed (robust unless n very small)
2. Homogeneity of Variances: Variances of errors are equal across groups $\sigma_1^2 = \sigma_2^2$. (robust unless group sizes unequal $n_{\max} / n_{\min} > 1.5$)
3. Independence: Errors are independent from each other (not robust)

We are skeptical!

Research questions:

1. t -test valid when the assumptions are met?
2. What happens when the assumptions are violated?

Plan

Create artificial data and check what happens

Recap definition 95% confidence interval estimator:

- ▶ Math: $\mathbb{P}(\theta^* \in \delta(D)) = 95\%$
- ▶ English: The true parameter is within 95% of the generated intervals

→ Generate many intervals (data sets) and check

Detailed Plan / Pseduocode

- ▶ Repeat often (Repeat)
 - 1. Generate data (Data)
 - 2. Calculate confidence interval (CI)
 - 3. Check: True value in confidence interval? (Check)
- ▶ Count how often true value is in confidence interval (Count)

Data: Loading and Looking at Data

```
data(sleep)
head(sleep)
```

```
##      extra group ID
## 1    0.7      1   1
## 2   -1.6      1   2
## 3   -0.2      1   3
## 4   -1.2      1   4
## 5   -0.1      1   5
## 6    3.4      1   6
```

Data: Loading and Looking at Data

```
sleep[c(1:3,18:20),]
```

##	extra	group	ID
## 1	0.7	1	1
## 2	-1.6	1	2
## 3	-0.2	1	3
## 18	1.6	2	8
## 19	4.6	2	9
## 20	3.4	2	10

CI: Performing the *t*-test

```
tResult <- t.test(extra ~ group, data=sleep, var.equal=TRUE)  
print(tResult)
```

```
##  
## Two Sample t-test  
##  
## data: extra by group  
## t = -1.8608, df = 18, p-value = 0.07919  
## alternative hypothesis: true difference in means is not  
## 95 percent confidence interval:  
## -3.363874 0.203874  
## sample estimates:  
## mean in group 1 mean in group 2  
## 0.75 2.33
```

CI: Extracting the Confidence Interval

```
confInter <- tResult$conf.int  
print(confInter)
```

```
## [1] -3.363874  0.203874  
## attr(,"conf.level")  
## [1] 0.95
```

Check: Check a value in CI

```
toCheck <- 0
if (toCheck > confInter[1] && toCheck < confInter[2]){
  isIn <- TRUE
}else{
  isIn <- FALSE
}
print(isIn)
```

```
## [1] TRUE
```

Data: Generating Artificial Data

5 Coin tosses from a fair coin

```
coinTosses <- rbinom(5,1,0.5)  
print(coinTosses)
```

```
## [1] 1 1 0 1 1
```

Data: Generating Normal Data

```
set.seed(1903)
group1 <- rnorm(n=10,mean=20,sd=1)
group2 <- rnorm(n=10,mean=3,sd=1)
print(round(group1,2))
```

```
## [1] 20.44 19.48 19.20 19.30 20.16 20.77 20.59 21.18 19
```

```
print(round(group2,2))
```

```
## [1] 2.31 2.01 3.61 1.87 4.02 4.29 3.48 3.03 2.92 2.97
```

Repeat: Repeating a Part

```
for (i in 1:3){  
  variable <- rnorm(n=1,mean=20,sd=1)  
  print(sprintf('Iteration: %d, Variable %.2f',i,variable))  
}
```

```
## [1] "Iteration: 1, Variable 19.65"  
## [1] "Iteration: 2, Variable 20.91"  
## [1] "Iteration: 3, Variable 19.86"
```

Count: Check + Repeat

```
tails <- 0
for (i in 1:5){
  coinToss <- rbinom(1,1,0.5)
  if (coinToss==1){
    tails <- tails + 1
  }
}
```

Pair Exercise

Repeat often (for i in 1:100)

1. Generate data according to the assumptions (rnorm)
2. Calculate confidence interval (t.test)
3. Check and Count: True value in confidence interval? (if ...;
count <- count+1)
